

COM410 Programming in Practice

T2. Comparison Operators

Comparison Operators

- Comparing primitive types is achieved through the standard comparison operators

Operator	Meaning	Example
<code>==</code>	Equal to	<code>if (a == b) { ... }</code>
<code>></code>	Greater than	<code>if (a > b) { ... }</code>
<code><</code>	Less than	<code>if (a < b) { ... }</code>
<code>>=</code>	Greater than or equal to	<code>if (a >= b) { ... }</code>
<code><=</code>	Less than or equal to	<code>if (a <= b) { ... }</code>
<code>&&</code>	And	<code>if (a == b && c == d) { ... }</code>
<code> </code>	Or	<code>if (a == b c == d) { ... }</code>
<code>!=</code>	Not equal to	<code>if (a != b) { ... }</code>

Comparing Objects

- Need to be very careful when comparing object types.
 - The comparison operators operate by checking the value represented by the element in the comparison
 - Two objects are considered equal if they are the same object (not if they hold the same value)
