

COM435 - Software Product and Process Management 2024-25

Lab Practical

Week 3

Task 1 – Identify Stakeholders

As a team you should identify a range of diverse stakeholders that could act as a customer segment for a value proposition canvas for the problem domain. You should include a student stakeholder in this list as it should be easier for teams to empathise with that cohort. If your list of stakeholders is quite large ($n > 5$) then you may wish to rank these in terms of your team's preference. You should have at least 5 stakeholders in total that you will go forward with in the next task.

Task 2

Taking each of the teams listed stakeholders in turn ($n=5$), produce a complete value proposition canvas for that customer segment:

- List job, functional, social and emotional
- List pains
- List gain
- Create/map pain relievers onto jobs
- Produce/map gain creators onto jobs
- Create/map products, services, features onto pain relievers and gain creators.

Task 3

Take the resulting products, services and features and incorporate these into your existing feature list. Some features will already exist, and some will be new.
