

COM435 - Software Product and Process Management 2024-25

Lab Practical

Week 4

A solid basis and foundation has been established having thoroughly researched the area and looked at a number of value proposition canvases for various stakeholders. This will allow you and your team to begin generating new idea and concepts in a more efficient manner as you should have a better understanding of the landscape around public transport systems.

Task 1

Using the following techniques start producing new concepts and ideas:

- Brainstorming
- Thinking hats – remember there is a creative hat
- Random stimulus

It's often easier to come up with creative ideas while in a group setting which can allow the conversation to flow and for the team to bounce ideas around. Completing this task in an isolated manner will not be as productive.

Task 2

Assuming you haven't been restricting the number of ideas as they flow you should have a decent number of new ideas, for example > 10.

The next natural step would be to review these new ideas to assess if they would be suitable and realistic to include as new features. Remember as this an academic exercise there are no budget restrictions, and you can assume existing technology is installed should you need it for the new idea to become a reality. If you have been generating ideas freely and in an unrestricted way then it's normal to expect a certain level of rejection as not all ideas will be realistic or sensible.

Task 3

In preparation for week 5, the team should finalise the list of features which will now include some new ideas. The list of features could be prioritised using the following model:

- Table stakes – features you think are a must to compete in the market
 - Rank these by user value
- Differentiator – new feature that separates from the competition
