

COM435 - Software Development Practice - 2023-2024

Lab Practical

Week 7

Your team should identify 5 user stories from those listed previously to detail in the coursework template. These may need a final check before inclusion.

The next step is to take each of the 5 user stories in turn and start to explore potential scenarios for both happy paths and unhappy paths within the context of each user story. Some guidance would be to identify a core happy path and an unhappy path that results from the core happy path. Teams can also identify two quite separate paths if required. It may also be useful to consider more than 2 scenarios for each user story so that the best 2 can be selected, this will increase the quality of the scenarios being included in the template.

You should also consider your spike stories after the scenarios have been created as that process may help you further understand an inherent risk.

Here are some suggested steps:

- Final check/review on top 5 user stories
 - Check for inclusion
 - Check quality / understanding
- Generate more than 2 scenarios for each user story
- Select the best 2 scenarios for each user story
- Discuss the 5 user stories and their more detailed scenarios from a risk perspective.
- Identify one technical and one functional spike story
- Spike stories
 - Write spike story following the format provided
 - Write a short paragraph on each spike story
 - Describe the risk
 - Evaluate the impact / likelihood of the risk
 - Describe how the risk will be mitigated
